Recruitment team   January 06, 2020

Oryctérope Transalpin Sàrl

Rue du Léman 18A

1920 Martigny

Dear Sir or Madam,

I am writing to you today because I think that I may be a good fit for the position you are proposing as an IT/DevOps engineer in Martigny.

I was born and raised near Grenoble, France, but my family was originally from Switzerland where I intend to relocate in the very near future, most of my family still lives in VD and VS.

For the last five years, I have been working in IT with a particular emphasis on information security, which led me to learn and use automation and what a lot of people call devops since it's such a good tool for system resiliency.

I have some experience in development, firstly because it was an integral part of my studies, secondly, because for a year and a half, I worked at Inria (a public research center) developing efficient password cracking strategies. My mission at Thales was to provide design considerations for the security of a complex cloud based SCADA project.

Finally, I spent the last three years in the IT department of a big software company. My mission was to work in close proximity to the CISO to implement the necessary evolutions in terms of security and automation of the infrastructure. I was also the main level 3 correspondant, with some level 2 support included.

I understand that the job you offer is for level 1 support, so I think I could be qualified for this as well. I am mostly proficient with GNU/Linux oriented technologies, my Windows knowledge lagging somewhat behind. I of course am very familiar with most networking technologies, at my previous occupation, I was often tasked to set up inter-companies VPN, installing networking infrastructure in new locations and monitoring all of it.

Since I was the main person in charge of most servers (approximately 150, running Debian on OpenStack), I am also quite used to Ansible, and somewhat competent with Kubernetes, though not to a point where I completely trust it yet.

I have to confess that I am looking for a more technical job than purely level 1 support, debugging user mistakes on excel and so on, but I am not against it being a part of the job.

I have to say your website doesn't tell me much about what actual product your company develops, but I understand that it is fintech and as such, I believe that my Infosec background may be especially useful.

I could be available from March 2020.

If you think that I could be a good fit for your needs, please do not hesitate to call or email me.

Kind Regards,

Pierre Rouveyrol
